SMRU HOSTEL CARE

A digital campus resolution hub

An overview of the hostel grievance portal, its user journey, visible capabilities, and the technologies used to build it.

10 categories shown	**3** user groups	**4** blocks claimed in interface	**24/7** access claim in interface

Prepared for institutional review

One clear channel for hostel concerns

SMRU Hostel Care is presented as a centralized grievance portal connecting hostel residents with the campus teams responsible for resolving day-to-day issues. It brings issue reporting, department routing, status visibility, announcements, and support information into one interface.

THE CHALLENGE

Hostel concerns can be difficult to track when they arrive through informal, disconnected channels. Students may not know which office owns an issue or whether it has been acknowledged.

THE RESPONSE

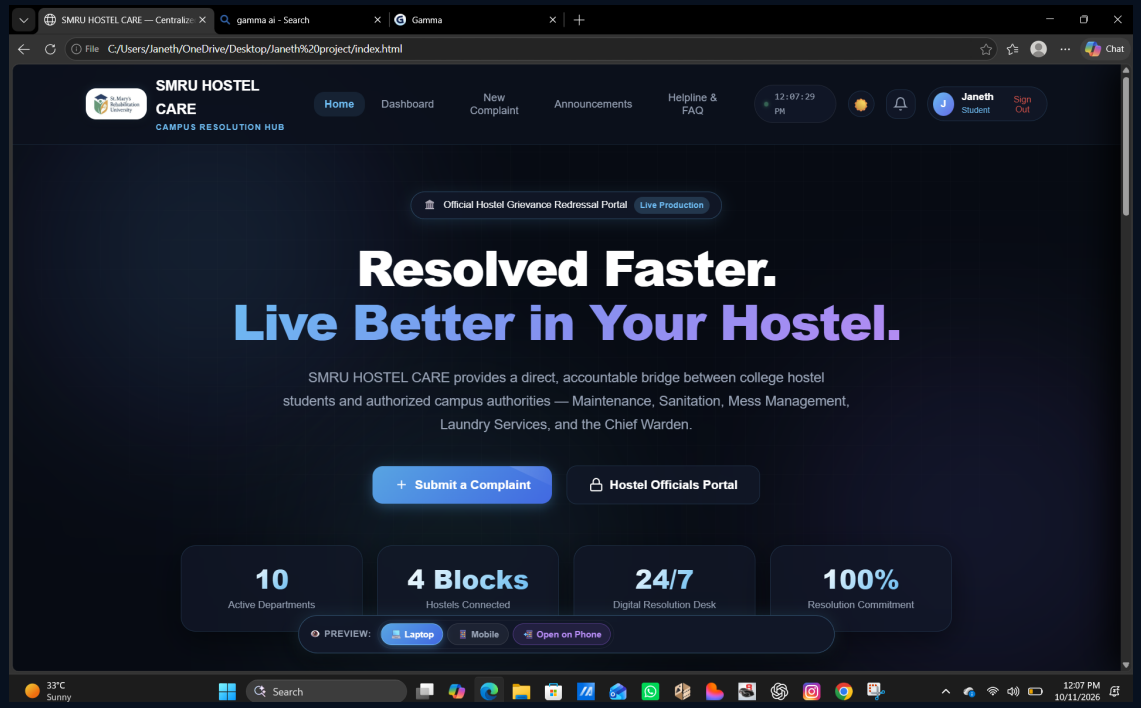

A structured online portal gives each concern a category, a responsible destination, and a visible place in the student's complaint history.

THE INTENDED VALUE

Improve clarity and accountability for residents and staff through a shared, organized process. Outcomes depend on operational adoption and timely action by the responsible teams.

Design principle: make it easy to report, easy to route, and easier to follow up.

A student-facing portal with operational entry points

HOME EXPERIENCE

The landing page introduces the service and directs students to submit a complaint or enter the officials portal.

ROLE-BASED ENTRY

The interface presents distinct access paths for students, service departments, and hostel administration.

CAMPUS SCOPE

The screenshot describes coverage across four hostel blocks and ten active departments. These are interface claims shown in the project preview.

Three role groups, one shared resolution process

HOSTEL STUDENTS

Submit room or service concerns, attach photo evidence, view progress, receive updates, and confirm repairs.

SERVICE DEPARTMENTS

Work from department-scoped queues for maintenance, sanitation, mess, and laundry; update statuses and add internal notes.

WARDENS & ADMINISTRATION

Oversee hostel-wide issues, handle escalations, issue campus notices, and review audit or analytics information.

A good operational handoff depends on clear ownership, appropriate access permissions, and staff procedures behind the portal.

From report to resolution

1	**Choose a category**	Select the closest matching issue type.
2	**Describe the issue**	Add the details needed to understand location and impact.
3	**Route to a team**	The interface says categories are associated with responsible departments.
4	**Track progress**	The student dashboard displays submitted, pending, in-progress, and resolved counts.
5	**Close the loop**	The student can review history and confirm a repair, as described on the portal.

Operational note: service targets, escalation thresholds, and response times should be agreed by the institution and configured to match policy.

Ten categories shown in the interface

The portal preview lists these categories and indicates a responsible destination for common issues.

Cupboard & locker

Shown route: Maintenance.

Bathroom problems

Shown route: Sanitation.

Food & mess

Shown route: Mess manager.

Cleanliness & sanitation

Shown route: Sanitation.

Security

Shown route: Office routing to confirm.

Water problems

Shown route: Maintenance.

Room issues

Shown route: Maintenance.

Dhobi & laundry

Shown route: Dhobi manager.

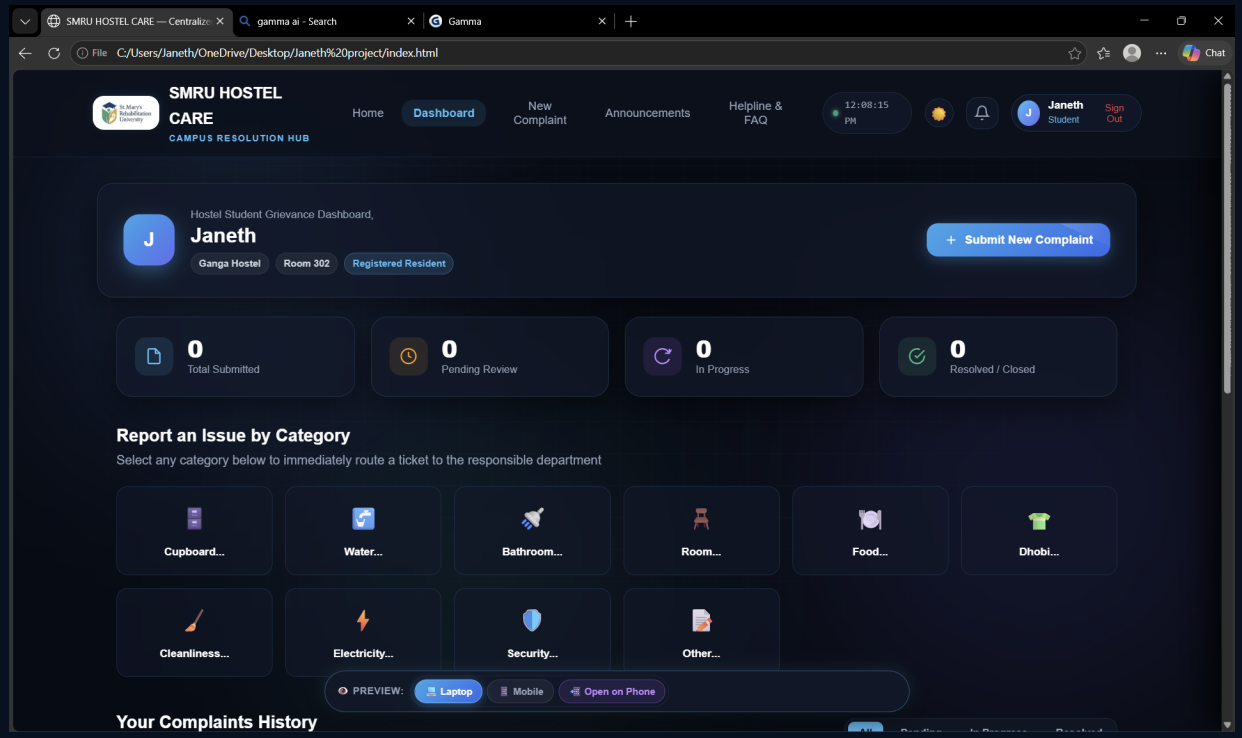

Electricity & internet

Shown route: Maintenance.

Other

Shown route: Manual triage / routing to confirm.

A quick view of complaint status and history

Screenshots are project interface evidence; the displayed counts are illustrative account state, not performance results.

AT A GLANCE

Four summary tiles distinguish total submissions, pending review, in-progress work, and resolved or closed complaints.

QUICK REPORTING

Category shortcuts provide a direct path into a new report.

FOLLOW-UP

A complaints history area is visible below the dashboard. The screenshot shows sample zero counts for the displayed student account.

Four technologies, four complementary roles

HTML | STRUCTURE

Defines page content and interface elements: navigation, forms, dashboard sections, category cards, and information hierarchy.

CSS | PRESENTATION

Controls layout, colors, typography, responsive behavior, spacing, and visual feedback across screen sizes.

JAVASCRIPT | INTERACTION

Connects user actions to interface behavior such as navigation, form interactions, dashboard updates, and notifications. Exact implemented features should be checked against the source code.

PYTHON | SERVER-SIDE LOGIC

Can power request handling, validation, routing rules, and data access behind a web portal. The screenshots do not identify the Python framework, database, or whether the current demo is connected to a live backend.

This is a technology-role explanation, not a code audit. Confirm the actual Python framework, storage, authentication, and deployment configuration before presenting those implementation details as facts.

A portal works best with clear service ownership

ACCOUNTABILITY

Assign every category to a named team and define who may reassign, escalate, and close a ticket.

PRIVACY

Limit complaint visibility to the student and authorized staff. Review photo uploads and personal details under institutional policy.

SERVICE LEVELS

Set realistic acknowledgement and resolution targets, with escalation when a case is overdue.

AUDITABILITY

Record status changes and staff actions so users and administrators can understand how a case progressed.

The interface describes notifications, photo evidence, privacy, audit trails, and SLA timers. Production readiness should be verified against the implemented system and institutional policy.

What the project is designed to improve

For students

A clear reporting path, less uncertainty about where to raise an issue, and a place to review progress.

For service teams

More structured intake, department-level ownership, and relevant case details in one queue.

For hostel leadership

A consolidated view of issue patterns, open work, escalations, and potential service bottlenecks.

For the institution

A foundation for consistent service processes and evidence-based improvements.

These are intended benefits. Quantified impact should be reported only after measuring actual usage and service outcomes.

Move from interface to dependable service

1 Confirm implementation	Review source code and verify the Python framework, database, file storage, authentication, and deployment model.
2 Test end to end	Validate report creation, category routing, staff updates, notifications, photo handling, and closure on desktop and mobile.
3 Establish governance	Approve roles, privacy rules, retention period, escalation ownership, and service targets.
4 Pilot and measure	Run a limited hostel pilot; track acknowledgement time, resolution time, reopen rate, and satisfaction.
5 Improve from evidence	Use pilot feedback and issue trends to refine categories, staffing, and portal usability.

SMRU HOSTEL CARE

A more visible path from concern to action.

A campus grievance portal concept built around structured reporting, department ownership, and student follow-up.

PRESENTATION NOTE

The screenshots show the project interface. Technical implementation details beyond the stated HTML, CSS, JavaScript, and Python stack should be verified against the source code before formal approval.
